## Marker Float Kit

This Marker Float system can be deployed and retrieved using a radio controlled boat. Firstly, find out the depth of the water where you intend to use the marker and measure a length of line adding two or three feet onto the depth. Then fasten one end of the line to the float, around the centre section, and the other end of the line to the weight supplied.

Wind the line around the centre section of the float until there is only a couple of centimetres of line left. This is now ready to take out, using the boat, and drop just beyond the position where you intend to fish.

At the end of your fishing session, when you wish to retrieve the marker float, tie approximately 1 metre of line to the treble (supplied) and the other end to the plastic clip (supplied) and attach the clip to the boat.

Drag the treble out behind the boat. When the boat arrives at the position where the float is, just manoeuvre the boat past the float and the treble will pick up the line and drag the float and weight back to the bankside.

If the line is not picked up by the treble, circle the float at different speeds until the pick up is completed. If you are fishing a weedy water then it is a good idea to fix the treble to an extra rod. Take out the treble in the boat and circle the marker as described, once you are happy that the boat has circled the marker line, open the hoppers, and retrieve the marker using the rod. This will ensure that the weight trailing through the water does not tangle in the weed and the boat is not struggling to free itself.
