

Cont'd.....

any of our boats as everything is determined from the operational signals that come from the microprocessor.

The "Baitboat" and "Microcat" have two hoppers which can either be opened together or individually. Therefore you can transport and release two rigs and free offerings at separate destinations, or drop two hoppers worth of free offerings around one rig. The "Procat" and "Technicat" have one hopper, so each rig and free offerings has to be delivered individually, which does not cause a problem because of the prolonged battery life. When using any of our boats you can reduce the amount of bait being taken out, as it all falls in a compact area, thus conserving expensive bait.

A good tip is to use PVA bags of bait with the rig attached, when fishing in water deeper than 8-10 feet, as the PVA bag will dissolve as the bag falls through the deeper water thus maintaining a tight presentation of bait on the lake bottom.

The aerial supplied for the "Baitboat" is a rigid telescopic to ensure good radio contact at range. Having said that, a short flexible aerial is available for working under over hanging trees, but this will shorten the overall boat range. The "Microcat", "Technicat" & "Procat" have no external aerials as they are installed internally. Each boat is supplied complete, ready to charge and use. The package contains the boat and transmitter, all the batteries and mains chargers required, a full set of operating instructions and a 12 month guarantee that covers any defects arising from faulty materials and workmanship.

Phil Fry

"A baitboat will not make a bad angler a good angler, but it will vastly improve their chances of catching fish"
